

Data processing: Design decisions.

- Because I wanted to show differences around the world I chose to use maps of continents and according to these maps draw different scatterplots.
- I chose to not include Oceania because there was no data available for the countries in Oceania for 2015.
- I chose to not change the axes according to specific continents to allow the viewer to see what the continents position is compared to the rest of the whole world.
- I tried to keep the colors in a certain theme (blue, grey) but unfortunately because I need to distinguish a lot of countries in the scatter plot I had to include a larger variety of colors.
- I chose to put the button in the center above the two graphs, which acts like a bridge between the two.
- By adding lines above and below the explanation on the page, it gives more structure to the page.
- Besides a small explanation above the map and the plot I chose to put the sources on the background page to keep the main page as clean as possible. That is also why I chose to include a navigation bar to redirect to the background and back to the home page.
- Because of the large variety of colors that are used in the graphs I chose to keep the rest of the page in more neutral and darker colors.
